

KeyNote 250

Phone System Product brief

Core Telecom
INNOVATIONS Inc

the future of telephony

Need a scalable phone system?

The **KeyNote 250** phone system offers the reliability and features you get from a traditional phone system, seamlessly coupled with the advanced capabilities of next generation technologies such as VoIP.

Revolutionizing how phone system software is engineered, our **KeyNotes** software packages are Vertically Focused. More than just a marketing concept, our VF Technology puts the needs of your business first. This allows businesses to converge not just their networks but also their applications.

KeyNote 250 eliminates licensing costs relating to individual users and devices. Scalability is determined by hardware performance, not artificially-imposed software locks.

Feature highlights

Intelligent Auto Attendant

Clients form an opinion of your company within the first 15 seconds of them calling you. The **KeyNote 250** has an intelligent Auto Attendant that can route calls based on time and the received phone number, allowing for intelligent and personalized call routing.

Voicemail

Our license-free platform delivers unlimited voicemail boxes because you do not have to pay for each seat. Whether your employees have a physical phone on the system or not, they can still have access to voicemail and all the benefits that come with it.

Find Me, Follow Me allows business people to never miss that important call again. Be continuously connected to the office. Need an advantage over your competition? Never missing those time-sensitive calls will put you in the driver's seat. An incoming call will ring at designated phones—at the office, on your cell and even at your home office—all at the same time.

Remote Conferencing capabilities

Password-protected conference rooms offer an *all connected* feature generally only available in large PBX's, providing an alternative to costly third-party conferencing services especially for the remote users.

More than three people can meet on your system from anywhere in the world.

Voicemail to E-Mail allows companies and individuals the ability to receive a voicemail message as an e-mail attachment. This is a very useful money saving tool for any travelling professional, no longer having to make expensive long distance calls to the office to retrieve messages. When you receive a voicemail to e-mail message, you simply play the attached WAV file. These messages can be handled as any other email message: Saved. Forwarded. Archived.
